- AKVIS Programs
If you take a photo of a black cat in a dark room the result can be far from ideal. Or if you make a photo of a beautiful view but the automatic settings focus on the sky and the shot comes out with uneven exposure - the sky is beautiful but the scenery is underexposed and one can hardly understand what is going on.

AKVIS Enhancer is image enhancement software that offers an individual approach to every part of the photo! The program offers a fast method to fix a dark picture, improve detail on an image, increase contrast and brightness, and adjust tones.

The software works in three modes: Improve Detail, Prepress, and Tone Correction. The main goal for these modes is the same - image enhancement, but the methods and the results are quite different. Different photos require different approaches at correction, in many cases the modes complement one another.

In Improve Detail mode, the program brings out details on an image by intensifying color transition. It strengthens the difference between adjacent pixels having different color gradations and allows revealing details in both shadows and highlights. This method is useful when you need to correct a photo with an uneven exposure or made in poor lighting conditions, get rid of haze or add a dramatic effect. It is the fastest and easiest way to fix dark pictures.

In Prepress mode, the program helps to adjust photos before printing or publishing online. Use this mode to increase the sharpness of borders and the contrast of the image. Even a high quality photo needs prepress processing that will give it a professional look.

In Tone Correction mode, the program makes corrections of the image brightness in light and dark areas. As a result the overall impression of the image improves considerably. Changes can be made to the entire image or only to selected colors.

Brighten up your pictures with AKVIS Enhancer!
The software is useful not only for correction of family and art photos, but can be efficient as well in technical use. Publishers of technical literature can apply Enhancer to show equipment illustrations in detail; doctors can use Enhancer to increase the level of detail on roentgenograms, etc.

AKVIS Enhancer is easy to use and learn. You can save frequently used settings as Presets and use them in the future. It optimizes your work and saves you time.

The program supports Batch Processing that lets you automatically process a series of images with the same settings.
The software is available as an independent standalone program and as a plug-in to photo editors. More...

The standalone version lets you use the Post Processing settings for further image correction, change brightness, contrast, gamma and saturation.

The plugin is compatible with AliveColors, Adobe Photoshop, Corel PaintShop Pro, etc. Check the compatibility.

During the trial period you can try all features of the software.
Follow the instructions to install **AKVIS Enhancer** in Windows.

- Start the setup exe file.
- Select your language and press the OK button to launch the installation process.
- To continue the installation process you have to read and accept the **License Agreement**. Activate the check box "**I accept the terms in the license agreement**", and press **Next**.

To install the **Plugin** you should select your photo editor(s) from the list. To install the **Standalone version**, make sure that the check-box **Standalone** is activated. To create a shortcut for the program on desktop, activate the component **Shortcut on Desktop**. Press the button **Next**.
• Press the button **Install**.

![Installation Progress]

• The installation is in progress.

![Completed Installation]

• The installation is completed.

You can subscribe to the **AKVIS Newsletter** to be informed about updates and events.
• Press **Finish** to exit Setup.

After installation of the **standalone** version of Enhancer, you will see a new line in the **Start** menu: **AKVIS - Enhancer** and a shortcut on desktop, if during installation the component **Shortcut on Desktop** was enabled.

After installation of the Enhancer **plugin** you will see a new item in the Filter/Effects menu of your photo editor. For example in Photoshop: **Filter -> AKVIS -> Enhancer**. Please use this command to launch the plugin in the editor.
Follow the instructions to install **AKVIS Enhancer** in a Mac computer:

- Open the virtual disk **dmg**:
  - **akvis-enhancer-app.dmg** to install the **Standalone** version
  - **akvis-enhancer-plugin.dmg** to install the **Plugin** to your image editor (Photoshop or Photoshop Elements).
- Read the **License Agreement** and press **Agree**, if you agree with the conditions.
- **Finder** will open with **AKVIS Enhancer** application or **AKVIS Enhancer PlugIn** inside.
- To install the **Standalone** version just drag the **AKVIS Enhancer** application into the folder **Applications** (or any other place you like).
  
To install the **Plugin** drag the entire **AKVIS Enhancer PlugIn** folder into the **Plug-Ins** folder of your graphic editor.

For example:

- if you use **Photoshop CC 2019, CC 2018, CC 2017, CC 2015.5**, copy the plugin into `Library/Application Support/Adobe/Plug-Ins/CC`;
- if you use **Photoshop CC 2015**, copy it into `Applications/Adobe Photoshop CC 2015/Plug-ins`;
- if you use **Photoshop CS6**, copy it into `Applications/Adobe Photoshop CS6/Plug-ins`. 
After installation of the plugin, you will see a new item in the Filter menu of your photo editor. In Photoshop select in menu: **Filter -> AKVIS -> Enhancer.**

Run the standalone app by double-clicking on its icon in Finder.
HOW TO ACTIVATE AKVIS SOFTWARE

Attention! During the activation process your computer must be connected to Internet.

If it is not possible, we offer you an alternative way (see below for Offline Activation).

Download AKVIS Enhancer and install the program. Read the Installation Instruction here.

When you run the unregistered version, a splash window will appear displaying general information about the version and the number of days left in your trial period.

You can also open the About the Program window by pressing the button in the program’s Control Panel.

Click on TRY IT to evaluate the software. A new window will appear with variants of licenses to test.

You do not need to register the trial version to try all features of the software. Just use the program during the evaluation time (10 days after the 1st start).

During the test period you can try all options and choose the license you like. Select one of the offered functionality types: Home (Plugin or Standalone), Home Deluxe, or Business. Your choice of license will affect which features will be available in the program. Consult the comparison table for more details about license types and versions of the software.

If the trial period has expired, the TRY IT button is disabled.

Click on BUY NOW to choose a license to order.

When the payment is effected, your serial number for the program will be sent to you within minutes.
Click on **ACTIVATE** to start the activation process.

Enter your name (the program will be registered to this name).

Enter your serial number (your license key).

Choose the method of activation — either direct connection to the activation server or by e-mail.

**Direct connection:**

We recommend activating the program using direct connection, as it is the easiest way.

At this step your computer must be connected to Internet.

Press **ACTIVATE**.

Your registration is completed!

**Request by e-mail:**

In case you have chosen activation by e-mail, a message with all necessary information will be created by the program.

**NOTE:** You can also use this method for **Offline Activation**:

If your computer is not connected to Internet, transfer the activation message to a computer connected to Internet, for example, with a USB stick. Send us this information to: activate@akvis.com.

**Please do not send the screenshot**! Just copy the text and save it.

We need your serial number for the software, your name, and HardwareID (HWID) of your computer.

We will generate your license file (**Enhancer.lic**) using this information and will send it to your e-mail address.

Save the .lic file (do not open it!) to your computer where you want to register the software, in the **AKVIS** folder in Users' Shared (Public) Documents:

- **Windows Vista/7/8/10:**
Users\Public\Documents\AKVIS;

- **Mac:**

  Users/Shared/AKVIS.

Your registration is completed!

When the program is registered, **BUY NOW** turns to **UPGRADE** that lets you improve your license (for example, change **Home** to **Home Deluxe** or **Business**).
AKVIS Enhancer can work independently as a standalone program or as a plug-in to a photo editor.

- **Standalone** is an independent program; you can open it by clicking on the program's icon.

  To launch the standalone version, run the program directly:
  - On a Windows computer - select it from the Start menu or use the program's shortcut.
  - On a Mac computer - launch the app from the Application folder.

- **Plugin** is an add-on for a photo editor, for example for Photoshop.

  To call the plugin, select it from filters of your image editing program.

The **AKVIS Enhancer** workspace looks like this:

The left part of the program's window is taken by the **Image Window** with two tabs: Before and After. In the Before tab the original image is shown, while in the After tab you can see the processed image. You can switch between the windows by clicking on a tab with the left mouse button.

You can select how Image Window and Before/After tabs will be shown by adjusting the **Image View Modes** in the bottom part of the left panel.
The **Control Panel** contains the following controls:

- The button 🏘️ opens the home page of **AKVIS Enhancer**.
- The button 📦 (only in the standalone version) opens image for processing. The hot-keys are **Ctrl+O** on Windows, **⌘+O** on Mac.
- Right mouse click on this button displays the list of recent files. You can change the number of recent documents in the program’s **Preferences**.
- The button 📦 (only in the standalone version) saves image to the disk. The hot-keys are **Ctrl+S** on Windows, **⌘+S** on Mac.
- The button 📦 (only in the standalone) opens the **Print** dialog to print the result. The hot-keys are **Ctrl+P** on Windows, **⌘+P** on Mac.
- The button 📸 lets posting pictures from the program to the social networks.
- The button 📊 imports a list of presets (from the `.enhancer` file).
- The button 📊 exports presets (user settings for the image processing). You can save any number of presets to a separate file with the ending `.enhancer`.
- The button 🧵 (only in the standalone version) opens the **Batch Processing** dialog to automatically process a series of images.
- The button ✅ starts image processing of the entire image (in the **Prepress** and **Tone Correction** modes).
- The button ✅ (only in the plugin version) applies the result to the image and closes the plugin’s window.
- The button 📖 calls information about the program and opens the registration window.
- The button 💡 calls the Help files. The hot-key is **F1**.
- The button 🎒 calls the **Preferences** dialog box for changing the program’s options.
- The button 📤 opens a window showing the latest news about Enhancer.

To the left of the **Image Window** there is the **Toolbar** with these tools:

- The button 🎨 (in the **Prepress** and **Tone Correction** modes) switches on/off the **preview window**.
- The button 🕳️ (only in the standalone version) activates the **Crop** tool which allows cutting off unwanted areas in the image.
- The button 🕳️ activates the **Hand** tool which allows you to scroll the image when it does not fit within **Image Window** at the desired scale. To use it click on the button, bring the cursor over the image, and while keeping the left mouse button pressed move in the desired direction.
- Double-clicking on the tool’s icon ⚡ on the **Toolbar** makes the image fit the **Image Window**.
- The button 🕵️ activates the **Zoom** tool, which changes the image's scale. To zoom in left click on
the image. To zoom out left click with Alt on the image. Press Z to quickly access the tool.

Double-clicking on the tool’s icon on the Toolbar makes the image scale to 100% (actual size).

And below, there are three buttons which control how the Image Window looks like.

You can navigate and scale the image using the Navigator. The frame in the Navigator surrounds the area of the image which is visible in the Image Window; the area outside of the frame will be shaded. The frame can be dragged, thereby changing the visible portion of the image. To move the frame, place the cursor within it, left click the mouse, and then drag.

To scroll the image in the Image Window you can press the spacebar on the keyboard and drag the image with the left mouse button. Use the scroll wheel of the mouse to move the image up/down, by keeping the Ctrl key pressed – to the left/to the right, by keeping the Alt key pressed – scale the image. Right-click on the scroll bar to activate the quick navigation menu.

Use the slider or the buttons + and - to scale the image. When you click on the + button or move the slider to the right, the image scale increases. When you click on the - button or move the slider to the left, the image scale reduces.

You can also change the image scale by entering a new coefficient into the scale field. The fall-down menu shows some frequently used coefficients.

You can use hot-keys to change the image scale + and Ctrl++ (⌘++) in Mac) to increase the image scale and - and Ctrl+- (⌘+- in Mac) to reduce the scale.

Below the Navigator is the Settings Panel where you can choose the image enhancement Mode and adjust its settings.

In the Presets field you can save favorite settings as a preset to use them in the future. When you launch the program, it uses the settings of the last used preset.

Under the Settings Panel you can see Hints for the parameters and buttons when you hover over them with the cursor. You can choose where the hints will be shown or hide them in the program’s Preferences.
IMAGE VIEW MODES: BEFORE AND AFTER

At the bottom of the Toolbar of AKVIS Enhancer, there are three buttons which let you choose how the Image Window will look like and arrange the Before and After tabs.

- Click the first button to open a submenu that contains various options for viewing the original and processed images:
  
  - The button provides the standard image window mode with two tabs: Before and After.
  
  - The buttons and divide the main window into two parts, vertically or horizontally, respectively. The original and processed images become partially visible and the tabs are combined to form the whole picture.

With this arrangement, it's possible to drag the splitter changing the aspect ratio between the Before and After parts.

- The buttons and split the main window into two parts, vertically or horizontally, as well. However, in contrast to the previous option, the windows display the same fragment of the image before and after processing.
**Note:** Use two windows side by side when you want to see and compare the original and processed versions of an image fragment on one screen. If you would rather see the final image as a whole, you can choose the standard image view mode.

- The button `çi` swaps the positions of the original image and result when displaying two windows.
- The 3rd button lets you choose the background color of the **Image Window**. Pressing ` `, ` `, or ` ` changes the background color to white, gray, or black, while clicking on ` ` opens the **Select Color** dialog where you can choose a color of your choice.
HOW TO USE THE PROGRAM

AKVIS Enhancer improves details on your pictures, fixes dark photos, adjusts tones, contrast, and brightness in images. It offers an individual approach to every part of the photo. The software can work independently as a standalone program as well as a plug-in to a photo editor.

Follow the instructions below:

**Step 1.** Open an image.

- If you work with the standalone edition:
  
The dialog box **Select File to Open** appears if you double-click on the empty workspace of the program or if you click on 📀. Use the hot-keys: Ctrl+O on Windows, ⌘+O on Mac. You can also drag the required image into the workspace of the program. The standalone program supports **JPEG, TIFF, BMP, PNG** and **RAW** file formats.

- If you work with the plug-in:
  
  Open an image in your **photo editor** by calling the command File -> Open.

  Call the plugin from the menu of the editor:

  - in *AliveColors* - Effects -> AKVIS -> Enhancer;
  - in *Adobe Photoshop* and *Photoshop Elements* - Filter -> AKVIS -> Enhancer;
  - in *Corel PaintShop Pro* - Effects -> Plugins -> AKVIS -> Enhancer;
  - in *Corel Photo-Paint* - Effects -> AKVIS -> Enhancer.

**Step 2.** Select the processing **Mode** in the drop-down menu in the **Settings Panel**.

**Improve Detail** mode helps to *bring out details* on an image. The program strengthens the difference between adjacent pixels having different color gradations and reveals details not only in shadows but even in overexposed and mid tone areas.

**Prepress** mode lets you adjust photos before *printing or publishing* in Web. The program increases the sharpness of borders and the contrast of the image.

**Tone Correction** mode is used for *color adjustment*. The program corrects brightness in the light and dark areas. As a result, the overall impression of the image improves considerably. Changes can be made to the entire image or to a part of the image depending on the selected colors.

You can find a comparison of the modes here.
Step 3. Adjust the parameters of the chosen **Mode** in the **Settings Panel**.

Step 4. If you like the new settings of the parameters, you can save them as a **preset** and use them later. To save the settings, enter a name for the preset in the **Presets** field and press the button **Save**.

When moving a cursor over a preset in the drop-down list, the quick result appears in the **Preset Preview** window.
To process the image with a certain preset, select this preset from the list. In **Improve Detail** mode the image will be automatically processed with the preset’s settings; in **Prepress** and **Tone Correction** modes press to run image processing.

Next time you launch the program, these settings will be used by default. If you change the parameters you can return to the initial settings of the selected preset by clicking on **Reset**.

To delete a preset, select it from the list and click on the button **Delete**.

**Step 5.** If needed, in the **standalone** version, you can **correct the image further** using the settings in the **Post Processing** tab.

**Step 6.** Share your image by clicking on . It opens the list of the services where you can publish the image.

In the standalone version, you can also **print** your result using .
**Step 7.** Save the result:

- If you work with the standalone program:

  Click on the button to open the **Save As** dialog box. You can use the hot-keys: **Ctrl+S** on Windows, **⌘S** on Mac. Enter a name for the file, choose the format (TIFF, JPEG, BMP or PNG) and indicate the target folder.

- If you work with the plugin:

  Press the button to apply the result and close the plugin window. The **AKVIS Enhancer** plugin will close and the picture will appear in the workspace of the photo editor.

  Call the **Save As** dialog box using the command **File -> Save As**, enter a name for the file, choose the format and indicate the target folder.
**IMPROVE DETAIL MODE**

In **Improve Detail** mode, the program brings out details in an image, in both shadows and highlights.

![Image Correction in Improve Detail mode](image)

Follow the instructions below to process the image in **Improve Detail** mode:

Adjust the value of the **Preview** parameter.

The **Preview** parameter is an auxiliary tool, it does not influence the real size of the image. The original image will stay the same and all details of the original image will be kept. This parameter speeds up the pre-processing stage when one tries different settings to obtain the best result.

When the **HQ** option is selected, the processing parameters are applied to the image in its original size. The processing time will increase but the preview quality will be as high as possible. If you select the **Fast** option, the preview size is smaller than the original image by 8 times. The processing time will decrease accordingly, but the result will be approximate. For intermediate values, the preview size is 2 and 4 times smaller than the original image.

**Attention!** Once you have adjusted the parameters, it is recommended to try the **HQ** processing to make sure that the best settings are chosen.
Adjust the image correction parameters. All changes are applied automatically.

**Shadows** (0-500). The parameter strengthens shadows in the image. Increasing the value makes dark areas even darker.

![Shadows = 50](image1)

![Shadows = 400](image2)

**Highlights** (0-500). The parameter lightens the image. Increasing the value makes light areas even lighter.

![Highlights = 50](image3)

![Highlights = 400](image4)

**Saturation** (-50..50). The parameter changes the color intensity of the image.

![Saturation = -25](image5)

![Saturation = 25](image6)
**Gradient Contrast** (0-50). The parameter helps to mildly increase the contrast in gradient areas making the image more prominent and expressive.

![Gradient Contrast](image1.jpg)

**Level of Detail** (0-50). The parameter defines the amount of detail. The higher the value, the sharper the outlines, and the more details are revealed in the image.

![Level of Detail](image2.jpg)

**Threshold** (1-10). The parameter defines which parts will be intensified when increasing the level of detail. At low values the program reveals all details in the image, at high values small details will not be changed.

![Threshold](image3.jpg)
Lightness (0-20). The parameter helps to illuminate dark areas. As you increase its value, the image becomes lighter.

Lightness = 5  
Lightness = 20
**PREPRESS MODE**

When printing photos, the result on paper will sometimes be different than what appears on your monitor. While the contours of objects may look perfect on the screen, on paper they may appear fuzzy. To avoid this, process the image before it is printed.

Use **Prepress** mode to increase the sharpness of borders and the contrast of the image.

Even if you are not going to print the photos you can use this mode to improve them. For example, before publishing in your online album.

![Original Image](image1.jpg) ![Result](image2.jpg)

To process an image in **Prepress** mode:

**Step 1.** Once this mode is selected the **Quick Preview** will appear. It is a square area outlined with the "marching ants". This lets you quickly preview the result in different areas of the image. You can move it to any part of the image - drag and drop or double click. To compare the result with the original picture, click and keep mouse pressed within the preview area.
You can change the preview area size in the program's preferences.

**Step 2.** Adjust the image processing parameters.

The parameters under **Sharpness** can be used to make an image appear sharper and its details clearer.

- **Radius** (1-100). This parameter determines the width of the zone in which the boundaries of objects are sharpened. A high value may cause halo artifacts.

- **Strength** (0-100). This parameter affects the degree of contrast enhancement along the boundaries of objects. When the parameter is increased the image becomes clearer. Its work depends on the value of **Radius**.

The parameters under **Contrast** enhance the contrast of the image by lightening light areas and darkening dark areas.

- **Shadows** (-50..100). This parameter enhances shadows. Increasing the value will make dark areas darker, while decreasing the value makes them lighter.

- **Highlights** (-50..100). When you move the cursor to the right of 0, the light areas of images become even more light. Moving the cursor to the left increases the number of gray tones.
**Step 3.** To process the entire image press ▶.
TONE CORRECTION MODE

Tone Correction mode is used for adjusting the image brightness in light and dark areas. As a result the overall impression of the image improves considerably. Changes can be made to the entire image or to a part of the photo depending on the colors selected for correction.

To process an image in Tone Correction mode, follow these steps:

**Step 1.** Once this mode is selected the Quick Preview will appear. It is a square area outlined with the "marching ants". This lets you quickly preview the result in different areas of the image. You can move it to any part of the image - drag and drop or double click. To compare the result with the original picture, click and keep mouse pressed within the preview area.
You can change the preview area size in the program's preferences.

**Step 2.** You can choose the colors to be corrected. To do this use the **Color Sets**.

The original set consists of seven colors. There are two additional sets below it, each consisting of three cells. Move colors from the main set into lower cells. By dragging colors you can have from one to three sets of colors. To switch from one color set to another click on it with the left mouse button. The chosen set is highlighted with a white background.

![Color Sets](image)

The **Color Indicator** makes it easier to form a color set.

![Color Indicator](image)

When you move the cursor over the image, this line displays the color components in the corresponding point. This helps to select colors more precisely, to edit the certain area.

**Step 3.** Adjust the parameters separately for each **Color Set**.

The selected set has a white background. Change the parameters for it:

- **Radius** (1-60). This parameter determines the area to be analyzed by the algorithm. After analysis, new color and brightness information is assigned to the point, to attribute it to one of the color sets, that is used for further processing.

- **Shadows** (0-100). The default value of this parameter is 0 and dark areas are not corrected. As the parameter’s value is increased, dark areas become lighter, and details there become more discernible. Objects in dark silhouettes become more like they were when photographed.

- **Highlights** (0-100). The default value of this parameter is 0 and light areas are not corrected. As the value of the parameter is increased, light areas become darker, contrast increases, and objects stand out more while the picture overall has more volume and appears more accurate.
**Note:** If color components do not belong to the same set, the application of the parameters is mixed. For example, if red and yellow there are in different sets, the correction of orange will be performed within both color sets.

**Step 4.** To process the image press the button.
**POST PROCESSING**

Use one of the modes in **AKVIS Enhancer** to improve a photo. For further image correction you can use the **Post Processing** tab. It is available only in the **standalone** edition because any image editor offers these features, so there is no reason to use this section in the plugin.

The **Post Processing** tab contains a **Histogram** and four parameters: **Brightness**, **Contrast**, **Gamma** and **Saturation**.

A **Histogram** is a graph that shows the tonal range of an image. On the horizontal line the brightness values are set - from the darkest to the lightest. The vertical line sets the number of pixels having this lightness value.

Below the histogram there are three sliders that can be moved to change the image contrast.

The extreme point on the right end represents pixels having the maximum brightness (white points). If the histogram does not have such pixels, the image does not contain any white points. If we move the white slider to the left, the point against which the slider is located will assume the maximum brightness (255) and the pixels having this value will become white. The brightness of other pixels will be re-calculated accordingly. The image will get lighter.

The extreme point on the left end represents pixels having the minimum brightness (black points). If the histogram does not start at the left end, the image does not have any black pixels (brightness = 0). If you move the black slider to the right, the point against which the slider is located will assume the minimum brightness value. As a result this tone will become black, while other pixels will be re-calculated accordingly. The image will get darker.

The middle slider defines the tone of the image that will have the brightness of 128 (middle-gray tones). If you move the slider to the left, the mid-gray tones get lighter; if you move the slider to the right, the mid-gray tones get darker.

Near the histogram there is a drop-down list with image channels (**RGB**, **Red**, **Green**, **Blue**, **Colors**, **Luminosity**). It is possible to adjust every channel separately or correct a combined channel.

The **Post Processing** tab also contains parameters that correct the brightness and contrast of the image, make gamma-corrections and change the saturation of the image.
The **Brightness** parameter is used to change the image brightness. It accepts values between -100 and 100 with the default value of 0. The higher is the value of the parameter, the lighter all pixels of the image are, and vice versa.

The **Contrast** parameter is used to increase (if the value is over 0) or reduce (if the value is under 0) the difference between bright and dark parts of the image. The parameter accepts values between -100 and 100 with the default value set to 0.

The **Gamma** parameter is used to change the overall contrast of the image by increasing or reducing mid-tones and gray mid-tones. The parameter accepts values between 50 and 250 with the default value set to 100.

The **Saturation** parameter is used to change the intensity of colors on the image. The parameter accepts values between -100 (gray color) and +100 (saturated colors). By default the value is set to 0.

As you adjust the settings in this tab, the processing is started automatically. The result is shown in the **After** tab.
AKVIS Enhancer supports **batch processing** that lets you automatically process a series of images.

Batch processing is available for all modes of the program. It is useful when dealing with a lot of photos taken under the same conditions with identical camera settings. It saves you time and effort.

Using batch processing is simple. Find the instructions how to work with **standalone** version. If you use the **plugin**, click here.
**BATCH PROCESSING WITH PHOTOSHOP PLUGIN**

The AKVIS plugins support the automation feature in *Adobe Photoshop*.

Batch processing is very useful and time saving when you have to apply the effects to a number of photos. This method applies the same settings to a folder full of images.

Even if you have never used batch processing you will find no difficulties in understanding it. First you create an **Action** in Photoshop and then apply it to a photo folder.

Follow the instructions:

**Step 1.** Create two new folders, for example: "source-files" and "result-files". Place original images into the "source-files" folder. The results will be saved in the "result-files" folder.

**Step 2.** Open one of the original images in *Adobe Photoshop*. We will use this photo to adjust the plugin's settings and create an action.

**Step 3.** In the **Actions** palette click **Create New Set** button. In the dialog window give a name for a new set of actions, for example, "AKVIS Actions".

If you already have a special set for the AKVIS actions, you can just choose it.

**Step 4.** Press **Create New Action** and give a name for it, for example, "Neon".
Press the **Record** button, and the recording of the action will immediately start.

**Step 5.** Call the plugin and adjust its parameters.
Step 6. Press the button \( \square \). The plug-in window will close and the effect will be applied to the image. In the Actions palette, in your new action, you will see a new line with the plugin's name.

Step 7. Remember that the action is still being recorded. Now, you should save the image. Choose Save As in the File menu and save the image into the destination folder.

Step 8. Stop the action recording by pressing Stop playing/recording at the bottom of the Actions palette.
Step 9. Delete the file that you have just saved.
Step 10. The action is created and you can proceed to batch processing of the photos.

In the File menu of the editor choose Automate -> Batch.

Step 11. In the Batch dialog window and set the parameters:
   In the Set drop-down list choose "AKVIS Actions" and the new action.
   In the Source option set Folder. Press the Choose... button and select "source-files".
   As the Open command was not recorded in the action, the Override Action "Open" Commands check-box should be deactivated.
   For Destination select Folder, then press the Choose... button and select "result-files".
   Activate Override Action "Save as" Commands check-box.
   In the File Naming section you can create the filenames structure for the resulted images. If you do not want to change the names, in the first combo-box choose document name, and in the second - extension.

Step 12. Press OK to start processing. Photoshop will apply the AKVIS plugin to all photos in the "source-files" folder, one by one, and will save them to the "result-files" folder.
Click on to open the Preferences dialog box. It looks like this:

- **Language.** Change the program language by selecting another from the drop-down list.
- **Interface Scale.** Choose the size of the interface elements. When it is set to Auto, the program workspace will automatically scale to fit the screen resolution.
- **Interface Theme.** Select the style of the program interface: Light, Gray or Dark.
- **Initial Scale.** This parameter defines the way the image is scaled in the main window after loading:
  - **Fit to View.** The scale adjusts so that the image will be completely visible;
  - **100%**. The actual size is used, the image doesn’t scale.
- The **Preview Window Size.** Choose the desired value for the size of the Quick Preview area in Prepress and Tone Correction modes: from 300x300 px to 1,000x1,000 px.
- **Hints Panel.** You can choose how the hints will be shown:
  - Under Settings Panel.
  - Under Image Window.
  - Hide.
- **Recent Files** (available only in the standalone version). The number of recent documents. The list of the recent files, sorted by time, become visible by right mouse clicking on . Maximum: 30 files.
- **Use OS File Dialog.** Enable this option if you want to use the System Open/Save Dialog. Otherwise, the AKVIS File Dialog is used.
- **Lock the Control Panel.** It disables the possibility to hide/show the top panel. If the check box is selected the panel is always visible.
- **Use GPU.** The check-box lets you turn on GPU acceleration. If your computer does not support GPU acceleration the check-box will be disabled.

To save changes made in the Preferences window press OK.

If you need, click on the button Default to come back the default settings.
PRINT IMAGES IN AKVIS ENHANCER

In the standalone version of AKVIS Enhancer you can print the image. Press the button 🌐 to open the Print options.

Adjust the parameters appearing in the Settings Panel:

Choose a printer from the list of available devices, set the desired resolution, as well as the number of copies to print.

In the Orientation group, set the position of paper: Portrait (vertically) or Landscape (horizontally).

Click the Page Setup button to open a dialog box to choose the size of the paper and its orientation, as well as the print margins.

Press the Reset Margins button to return the page margins to the default size.

Change the size of the printed image adjusting the parameters Scale, Width, Height and Fit to Page. These parameters have no effect on the image itself, just on the print version. You can change the size of the printed image by entering any value in %, or by entering new values in Width and Height.

To adjust the size of the image to the paper size, select Fit to Page.

Move the image on the page with the mouse or align it using the arrow buttons.

You can activate Frame for the image and adjust its width and color.

Choose the Background Color by clicking on the color plate.

In the Page tab, you can adjust printing of the multiple copies of the image on a single sheet.
Print Page

- **Copies per Page.** It lets you specify the number of copies of the image on one page.
- **Horizontally** and **Vertically.** These parameters indicate the number of rows and columns for the copies of the image on the page.
- **Spacing.** The parameter sets the margins between the copies of the image.

In the **Poster** tab, it's possible to customize printing of the image on multiple pages for the subsequent junction into a large picture.

Print Poster

- **Pages.** If the check-box is enabled, you can specify the maximum number of the pages in which the image will be divided. The image scale will be adjusted to fit this number of the sheets. If the check-box is disabled, the program will automatically select the optimal number of the pages in accordance with the actual size of the image (scale = 100%).
- **Glue Margins.** If the check-box is enabled, you can adjust the width of the padding for
bonding sheets. Margins will be added to the right and to the bottom of each part.

- **Lines of Cut.** Activate the check-box to display the cut marks in the margins.
- **Show Numbers.** With the enabled check-box, a sequence number of each part, by a column and a row, will be printed in the margins.

To print the image with the chosen parameters, press the **Print** button.
To cancel and close the printing options click on **Cancel**.

Click the **Properties...** button to open a system dialog box that enables you to access the advanced settings and send the document to print.
The **Tone Correction** mode in **AKVIS Enhancer** is useful when you want to increase or decrease the brightness of a particular color in an image.

We'll demonstrate this with a photo of strawberries.

Open the image.

First let's try to enhance the color of the berries. Do this by dragging the **red** color from the initial color set into one of the empty sets.

The selected color set will be highlighted in white. Let's adjust the settings for this color set.

Increase **Highlights** to 70, and **Radius** to 45. This results in rich, dark berries. The color of the leaves has not changed.
Now let's make the color of leaves darker. Drag the green color into another free color set.

For the set with green, increase Highlights to 90.

Press to apply the settings to the entire image. The leaves appear darker and richer and overall the picture looks more natural.

In this way, strengthening or weakening specific colors in an image can lead to different and quite pleasant results.
CRYSTAL CLEAR

When you look at your photo, you think it's clear, but try processing it with AKVIS Enhancer in Prepress mode and you'll see what the definition of clarity truly is!

In this tutorial, we'll process a photo of ice cubes. It already looks good, but does not evoke the feeling of seeing ice cubes through a frosty glass.

![Original Image](image1.jpg) ![Result](image2.jpg)

Click on the image to see a larger version in a new window

**Step 1.** Open the image to be processed in AKVIS Enhancer. Choose Prepress from the list of modes.

![AKVIS Enhancer](image3.jpg)

**Step 2.** The Preview area shows the result of the image processed with the default settings. The image looks clearer, but the settings should be adjusted further to achieve a better result. Change the settings to match those in the image below.
**Step 3.** All that’s left to do is to click on the right arrow to apply the settings to the entire image.

The details in the resulting image are clearer as can be seen in the small droplets of water on the ice cubes. The ice cubes look so natural that you could almost reach out and touch them!
LIGHTEN A DARK STREET PHOTO

When you take a photo in the street where the lighting is poor, you will notice that the subject of the shoot turns out to be dark and hardly visible. With the Improve Detail mode in AKVIS Enhancer you can reveal details in shadows.

![Original Image vs Result](image.png)

We use the Enhancer plugin in the tutorial, but you can take the standalone edition and use the same parameters to achieve this result.

**Step 1.** Open the image in your photo editor to work with the Enhancer plugin, for example in AliveColors (or just run the Enhancer program if you use it as a standalone app).

**Step 2.** To call the Enhancer plugin in AliveColors select the command Effects -> AKVIS -> Enhancer; in Adobe Photoshop select the command Filter -> AKVIS -> Enhancer; in Corel Paint Shop Pro select Effects -> Plugins -> AKVIS -> Enhancer.

Choose Improve Detail mode. The image will be processed with the default settings.
Step 3. Taking into account that the photo is underexposed, we need to reveal more details in the dark areas. Increase the **Lightness** parameter and adjust other settings to achieve the desired look.

Step 4. In the plugin, press the button ✅ to apply the result of the photo correction.
AKVIS PROGRAMS

AKVIS AirBrush — Airbrushing Techniques on Your Photos
(Windows | Mac)

AKVIS AirBrush automatically transforms a photograph into a work of art which looks like made with a special airbrush tool that sprays paints or inks. The software works as an artistic filter creating stylish colorful airbrush designs from images using chosen settings of photo-to-painting conversion. More...
